The India Way May 13 2022 The decade from the 2008 global financial crisis to the 2020 coronavirus pandemic has seen a real transformation of the world order. The very nature of international relations and its rules are changing before our eyes. For India, this means optimal relationships with all the major powers to best advance its goals. It also requires a bolder and non-reciprocal approach to its neighbourhood. A global footprint is now in the making that leverages India's greater capability and relevance, as well as its unique diaspora. This era of global upheaval entails greater expectations from India, putting it on the path to becoming a leading power. In *The India Way*, S. Jaishankar, India's Minister of External Affairs, analyses these challenges and spells out possible policy responses. He places this thinking in the context of history and tradition, appropriate for a civilizational power that seeks to reclaim its place on the world stage.

Plant Virus and Viroid Diseases in the Tropics Jan 17 2020 Plant virus and sub-viral pathogens pose severe constraints to the production of wide range of economically important crops worldwide. The crops raised both through true seed and vegetative propagated materials are affected with number of virus and virus-like diseases. The virus may enter into plants through seed planting materials or by vectors. Once the virus is in the field, it multiplies and spreads following definite patterns depending upon the nature of the vector and agro-meteorological conditions. Disease free crops and plants are great economic and social importance in feeding the world's population. Detection of virus and sub-viral agents at initial stages of infection is critical to reduce economic losses. For nearly two decades, ELISA and its variants played a major role in large scale virus testing and also in the production of virus-free planting materials.

Encyclopedia of Plant Viruses and Viroids May 01 2021 The Encyclopedia of Plant Viruses and Viroids provides an up-to-date information on the viruses and viroids infecting all types of cultivated and weed plants at global level; and is unique among plant virology texts as it is organized alphabetically by the genus name of the host plant infected. It allows the reader to readily determine all of the different viruses currently reported naturally infecting the plant genus and species. Information is provided for each virus and viroids on common synonyms, current taxonomic status, geographical distribution, symptoms induced, other known hosts, means of transmission and properties of both the virus particles and the genome. Where ever the same virus is known to infect multiple hosts, host-specific information, biological properties and genome characters are presented under each host affected. The index can be utilized to identify other crops infected by the same virus, showing which other crops might be at risk of infection in the event of introduction of a virus that has not previously reported in an area, or which might serve as potential virus reservoirs for infection of more sensitive or economically important crops than the host in which it is initially identified. The taxonomy and nomenclature of the viruses and viroids are followed based on the current guidelines of the 10th ICTV Report, covering up to 2018 and also about many new viruses and viroids that have been reported but not yet recognized as species by ICTV, have been included in this Encyclopedia. The uniqueness of this Encyclopedia is that all the known viruses and viroids affecting more than 1010 plant species at global level are described and the plant species are arranged in alphabetical order of the scientific name of the plant along the relevant information on 1518 viruses and viroids and is the ready-reckoner of the global plant species and their viruses and viroids for students, scientists, teachers of Plant Pathology & Virology; and also for the crop protection professionals, agricultural policymakers, seed companies and quarantine agencies.

Applied Principles of Hydrology Jun 02 2021 Less than 1% of the Earth's water is available for human use, the average family uses 400 gallons of water daily, and expected population growth means an increase in water use. The study of hydrology—how water behaves as it moves through the water cycle—is vital to reducing strains on our water supply and infrastructure. Written for those who want to understand hydrologic principles without a background in mathematics, Manning's basic water science text begins with the physical and chemical

attributes that make water a unique substance and proceeds with a step-by-step discussion of the water cycle. Scientific principles are illustrated by real-world examples, while “investigations” sections offer practical suggestions for making measurements and/or interpretations of hydrological variables in the local environment and for applying principles discussed in the text. This well-structured, reader-friendly text benefits not only students in elementary hydrology courses, but also those studying broader areas of natural resources, ecology, geography, and urban planning.
